

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

~~1. (Currently Amended) An image quality analysis system for an image output~~

device, comprising:

a test pattern pertinent to image quality determination;

a scanner that scans a hardcopy test image, which has been generated by the output device based on the test pattern, to form a digital raster image; and

an image quality analysis module that receives the digital raster image, distinguishes one or more test targets from the digital raster image, and performs image quality analysis on the test targets to obtain results quantifying image quality that are based on human visual system models.

2. (Canceled)

3. (Original) The image quality analysis system of claim 1, wherein the image quality analysis module resides locally at a site of the image output device.

4. (Original) The image quality analysis system of claim 3, wherein the image output device is a copier that contains the scanner.

5. (Original) The image quality analysis system of claim 1, wherein the scanner and the image quality analysis module reside remote from the image output device.

6. (Original) The image quality analysis system of claim 1, wherein the test pattern is stored in memory at the image output device.

7. (Original) The image quality analysis system of claim 1, wherein the image output device is a copier having an input scanner section serving as the scanner and an output printer section, and the test pattern is in the form of a hardcopy printout that is subsequently scanned into the input scanner section and output as the hardcopy test image.

8. (Canceled)

9. (Currently Amended) The image quality analysis system of claim 81, wherein further comprising a communication module that connects the image quality analysis module to a remote facility and the results of the image quality analysis are formed to the remote facility through the communication module.

10. (Original) The image quality analysis system of claim 9, wherein the remote facility includes a diagnostic module that returns information pertinent to correcting any undesirable image quality test results.

11. (Original) The image quality analysis system of claim 1, wherein the image quality results are independent of the particular image output device or scanner used, such that comparisons of results can be made between differing image output devices.

12. (Currently Amended) A method of performing image quality analysis on an image output device having an output station that generates a hardcopy image from a digital image, the method comprising:

generating a hardcopy image output from the image output device based on a predetermined test pattern;

scanning the hardcopy image using a scanner to form a digital raster image;

identifying test targets within the digital raster image using pattern recognition software; and

performing image quality analysis on the test targets based on human visual system (HVS) models so that the image quality analysis provides results indicative of image quality that reflect human perceptions of image quality.

13. (Canceled)

14. (Original) The method of claim 12, further comprising a step of sending a communication to a service facility.

~~15. (Original) The method of claim 14, wherein the communication is a service call if~~
the image quality results as less than desirable.

16. (Original) The method of claim 14, wherein the communication is the transfer of
the image quality results to the service facility.

SP
17. (Original) The method of claim 16, further comprising the steps of analyzing the
results along with predetermined image output device operating parameters and
communicating information to the image output device relevant to correcting the undesirable
image quality.

al
18. (Original) The method of claim 12, wherein the image output device is a copier
that contains the scanner.

19. (Original) The method of claim 12, wherein the method is automatically initiated
by the copier at a predetermined time.

20. (Original) The method of claim 12, wherein the steps of scanning and analyzing
are performed remote from the image output device.

21. (New) The image quality analysis system of claim 1, further comprising a filter
that filters the test targets prior to analysis using a human visual perception model so that the
test target is similar in resolution to that perceivable by a human visual system.

22. (New) The method of claim 12, further comprising a step of filtering the test
targets using a human visual perception model.
